CUSTOMER PROOF OF CONCEPT

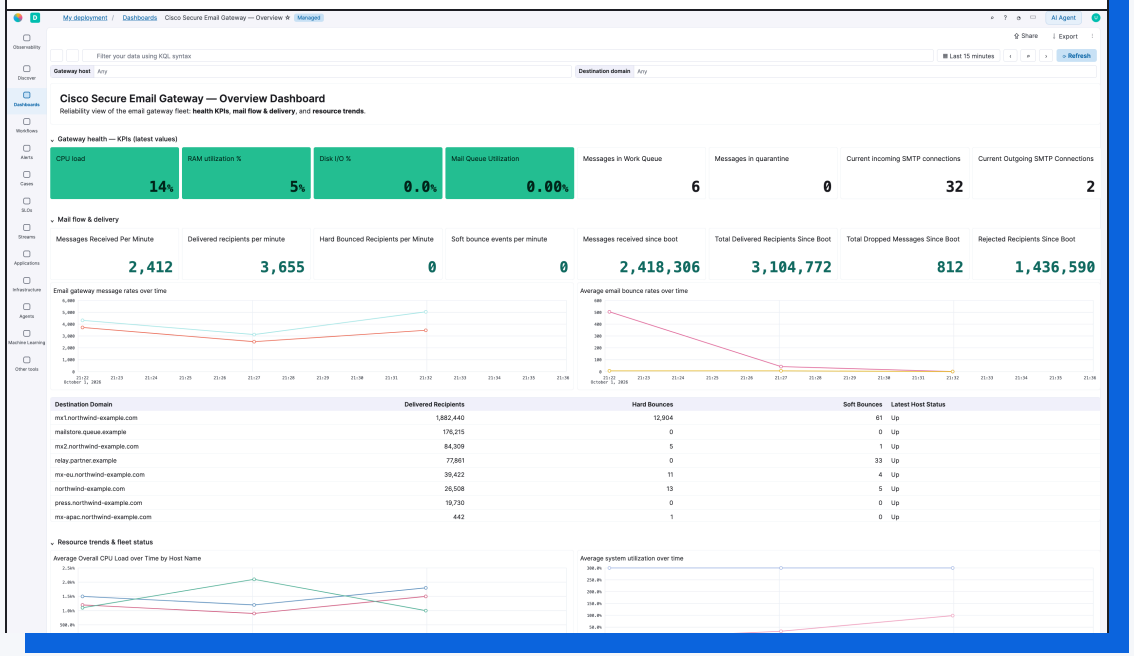

Operational visibility for Cisco Secure Email Gateway.

A metrics-only demo for email administrators who need to detect delivery pressure before business users feel the impact.

PERSONA: EMAIL ADMIN

METRICS ONLY

ELASTIC DASHBOARD

Elastic brings gateway health, mail flow, queue pressure, destination-domain delivery, and host status into one operational view.

elastic

CISCO SECURE EMAIL GATEWAY

CUSTOMER CHALLENGE

Email delivery issues need to be visible before tickets arrive.

For an email administrator, the first question is simple: is the problem coming from the gateway, a destination domain, or normal traffic variation?

CURRENT CHALLENGE

Email teams need earlier warning signs than helpdesk tickets.

Elastic shifts the starting point from user-reported symptoms to live operational signals.

- Gateway health
- Mail flow rates
- Bounce rates
- Queue pressure
- SMTP connections
- Host status
- Destination domains
- Fleet trends

SCENARIO 01 · LEAD STORY

Detect delivery pressure before users complain.

The customer wants earlier warning when email still enters the gateway, but delivery quality starts to degrade.

PAIN

Delivery issues surface through tickets.

By the time users report delayed or rejected email, the operations team already works from a reactive position.

ELASTIC APPROACH

Correlate mail flow, queue pressure, and gateway health.

Elastic shows the signals that indicate delivery pressure and gives the administrator filters to narrow the scope.

- RECEIVED RATE
- DELIVERED RATE
- QUEUE GROWTH
- SMTP CONNECTIONS

BENEFIT

Act before business impact becomes visible.

The admin can decide whether to investigate a gateway, queue buildup, destination domain, or external mail dependency.

SCENARIO 02 · DOMAIN SCOPE

Identify whether the issue affects one destination domain.

The customer wants to understand whether delivery problems come from the gateway fleet or from a specific external destination.

PAIN

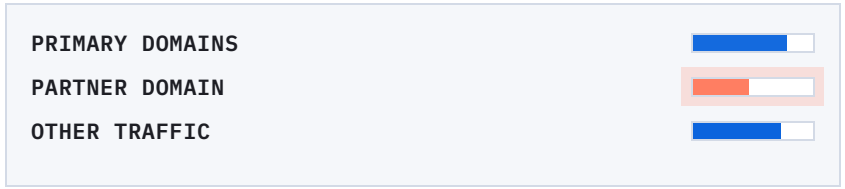

One partner domain reports delayed or rejected email.

Without domain-level visibility, the team spends time proving whether the problem is internal or external.

ELASTIC APPROACH

Compare delivery and bounce signals by domain.

Elastic lets the administrator filter by destination domain and compare delivery, hard bounces, and soft bounces.

BENEFIT

Separate internal operations from external delivery problems.

The admin can communicate scope clearly and focus the next action on the right owner.

Connect queue growth with gateway capacity.

The customer wants to know whether delivery pressure comes from traffic volume, queue buildup, or host resource drift.

PAIN

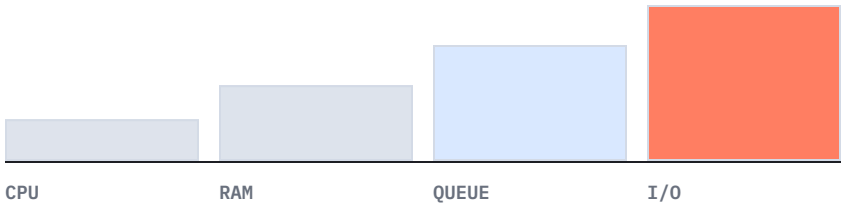

Traffic peaks can hide emerging capacity limits.

Mail may still move, but rising queues and resource drift can signal a future service risk.

ELASTIC APPROACH

Track queues beside host and system metrics.

Elastic links queue trends with CPU, RAM, disk I/O, system utilization, SMTP connections, and latest host status.

BENEFIT

Support capacity planning with operational evidence.

The team can explain when to investigate a gateway, rebalance traffic, or plan scaling with data from the same view.

Gateway metrics become an actionable workflow.

One view supports daily monitoring, incident triage, and capacity conversations.

Detect earlier.

Spot delivery degradation before business users open helpdesk tickets.

Isolate faster.

Separate gateway health, queue pressure, and destination-domain behavior.

Act with context.

Use host and fleet metrics to prioritize the next investigation.

Reuse the view.

Support operations teams after the POC with the same monitoring pattern.
